Delhi NCR, India | Open to onsite, hybrid and remote | Available to join immediately

Professional Summary

Senior Frontend Engineer with 7 years building React, Next.js and Angular applications for SaaS, fintech and data-intensive products. Sole frontend engineer on three React products from empty repo to production (Paper Tiger, Block Power, Qbench), and set up and stabilized a Next.js contract platform serving thousands of vendors. Strong in TypeScript, Redux, React-Query, custom hooks and performance work, with two production LLM chat features, Stripe billing, and daily agentic AI development under strict code review. Leads developers, estimates directly with clients, and has mentored 6+ engineers.

Technical Skills

React: React, Next.js (Pages Router, SSR/SSG), Redux, React-Query, custom hooks, Context API, React.memo, useMemo, useCallback, React.lazy and code splitting

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3, SCSS/SASS

UI: Tailwind CSS, Material UI, DevExpress (DevExtreme), TinyMCE, AG-Grid Enterprise, AG Charts, Bootstrap, design tokens, shared component libraries, responsive and mobile-first design

Architecture and Performance: Frontend architecture, config-driven forms and tables, lazy loading, bundle splitting, server-side pagination, row virtualization, data prefetching, API response caching, Lighthouse, Chrome DevTools profiling

APIs, Auth and Payments: REST, WebSockets, JWT, OAuth 2.0, Google Sign-In, role-based access control, Stripe Checkout and subscriptions, Gravity Payments

Cloud: Pre-signed URL uploads, AWS S3, Azure Blob Storage, Google Cloud Storage, Cloudinary

AI Engineering: LLM product features (OpenAI, Anthropic, streaming chat over WebSockets, markdown answers, retry and auto-reconnect), agentic coding (Claude Code, Cursor, GitHub Copilot agent mode, Codex), AI code review, project rules files and shared prompts, v0

Angular: Angular (v20 to v7), standalone components, OnPush, RxJS, NgRx, NGXS

DevOps and Tooling: GitHub Actions, CI/CD, Docker, Git, ESLint, Prettier, Webpack, Babel, Jira, Postman, Linux, VS Code

Leadership: Team leadership, estimation and sprint planning, client communication, requirements analysis, code review, mentoring

Professional Experience

Finoit Technologies – Noida, India (Remote)

July 2019 – July 2026

Senior Software Engineer

January 2023 – July 2026

CCM – Contract and Vendor Management Platform – *React, Next.js, Redux, TypeScript, WebSockets*

- Set up the production Next.js codebase (Pages Router with SSR and SSG) from client-provided AI-generated UI (v0), including architecture, tooling and reusable boilerplate, for a platform managing thousands of vendors and about 100 users.
- Reviewed code for 2 developers, then stabilized a codebase where forms and features broke almost daily until errors became rare.
- Built AI Sync, a streaming LLM chat over WebSockets for querying and summarizing a user's assigned contracts, with markdown-rendered answers, retry on errors and automatic reconnect; plus the User module for admin access control.
- Built complex forms with conditional, nested dependent fields and data tables for contracts and vendors; used React.memo, useMemo, useCallback, lazy-loaded pages and API caching to avoid re-renders and repeat calls.
- Built direct-to-S3 uploads via pre-signed URLs (up to 25 MB per file) with JWT authentication.

Paper Tiger – Academic Research and Writing Platform – *React, Redux, DevExpress, TinyMCE, Google Cloud*

- Sole frontend engineer from empty repo to production: architecture, routing, error handling, API layer, and OAuth 2.0 / Google Sign-In authentication.
- Built all five modules (Outliner, Reader, Explorer, Builder, Writer), including a DevExpress drag-and-drop Kanban, a TinyMCE word processor with highlighting and annotation, and PDF upload and citation management.
- Handled about 2 MB of JSON per research paper on the client, with signed-URL uploads to Google Cloud Storage and file metadata in Redux to avoid stale cached values; built shared logic as custom hooks and Context.

Block Power – Community Engagement and Voting Platform – *React, Redux; client: Harvard professor*

- Sole frontend engineer on a mobile-first React app for about 250 users: referral points, challenges, rewards, voting and nomination flows, with role-based access for multiple user types in one app.
- Estimated work and took requirement calls directly with the client alongside the PM.

DDMind – Private Equity Research and Investment Analysis Platform – *Angular 16 to 20, AG-Grid, AG Charts, WebSockets*

- Led a team of 2 developers as main developer; ran requirement analysis, estimation and planning directly with the client.
- Brought 20,000+ financial records out of heavy Excel workbooks into the app and re-architected data grids (17,000+ rows in one table) with server-side pagination, infinite row model, row virtualization and page caching, cutting load time by 8–10 seconds and eliminating UI freezes.
- Proposed and led a framework upgrade (Angular v16 to v20) for the client's certification needs, cutting bundle size 12% and build time 8%; built a streaming LLM chat over switchable OpenAI and Anthropic models.
- Reverse-engineered a reference product's market-data processing flow and replicated it on the frontend, shaping request and response structures so the backend could call the same market-data APIs consistently.

Across projects

- Used AI coding agents (Claude Code from the start of DDMind, plus Cursor, GitHub Copilot agent mode and Codex) for feature scaffolding, multi-file refactors and migrations, debugging and task breakdowns; reviewed and ran every change locally, gated it with lint and CI, and discarded agent output that missed requirements or was not optimal, keeping design decisions human-led.
- Set up project rules files and shared prompts for AI tools, and coached my team on reviewing AI-generated code before it merged.
- Established quality gates reused on DDMind and CCM: ESLint and Prettier on pre-push hooks, the same checks in GitHub Actions before deployment, and Dockerized dev environments.
- Built shared component folders (loading buttons, config-driven form fields, tables) and design tokens (SCSS variables, Tailwind theme) on every project.
- Mentored 6+ engineers, including engineers outside my own project teams, through code review, architecture discussions and debugging.

Software Engineer

January 2022 – January 2023

Qbench – Laboratory SaaS Customer Portal and Billing – *React, Redux, React-Query, Stripe*

- Sole frontend engineer: built a config-driven engine rendering dynamic forms and tables from backend configuration, so admins customize the portal without code changes.
- Built the billing and subscription module on Stripe Checkout (payments, invoices, transactions), React-Query data caching, custom hooks, and direct uploads to Azure Blob Storage via pre-signed URLs.
- Together Now (React, Redux, React-Query): added commenting and status-based approve/reject flows, responsive to tablet width.

Software Developer (joined as Trainee Software Developer)

July 2019 – January 2022

- Built Angular applications with NgRx and RxJS: Youxta (lawyer hiring, Stripe payments, booking), Ignite (drag-and-drop career-page builder) and Envy Pet Care (AG-Grid, FullCalendar, Gravity Payments via emulator); contributed to the Angular v6 to v8 upgrade.

Education

B.Tech, Computer Science & Engineering (Lateral Entry) – Maharaja Surajmal Institute of Technology, New Delhi 2014 – 2017

Diploma, Computer Science & Engineering – Ambedkar Polytechnic, New Delhi 2010 – 2013
