Professional Summary

Senior Frontend Engineer with 7 years building enterprise Angular applications (v7 to v20) for fintech research, SaaS and data-intensive products. Proposed and led an Angular v16 to v20 upgrade (standalone components, new control flow, OnPush) that cut bundle size 12% and build time 8%, and re-architected AG-Grid views over 20,000+ financial records to load 8–10 seconds faster. Strong in TypeScript, RxJS, NgRx and NGXS, with production LLM streaming chat over WebSockets. Leads developers, estimates and plans directly with clients, and has mentored 6+ engineers.

Technical Skills

Angular: Angular (v20 to v7), standalone components, new control flow (@if/@for), OnPush change detection, trackBy, RxJS, NgRx, NGXS, BehaviorSubject services, lazy-loaded modules

Languages: TypeScript, JavaScript (ES6+), HTML5, CSS3, SCSS/SASS

UI and Data: AG-Grid Enterprise (server-side and infinite row models, cellRenderer, valueFormatter), AG Charts, Angular Material, Tailwind CSS, Bootstrap, design tokens, shared component libraries, responsive and mobile-first design

Architecture and Performance: Frontend architecture, feature modules, lazy loading, bundle splitting, server-side pagination, row virtualization, data prefetching, API response caching, config-driven forms, Lighthouse, Chrome DevTools profiling

React: React, Next.js (Pages Router, SSR/SSG), Redux, React-Query, custom hooks, Context API

APIs, Auth and Cloud: REST, WebSockets, JWT, OAuth 2.0, Google Sign-In, RBAC, pre-signed URL uploads, AWS S3, Azure Blob Storage, Google Cloud Storage, Cloudinary, Stripe

AI Engineering: LLM integration (OpenAI, Anthropic), streaming chat UIs, v0; GitHub Copilot, Claude, ChatGPT, Codex

DevOps and Tooling: GitHub Actions, CI/CD, Docker, Git, ESLint, Prettier, Webpack, Jira, Postman, Linux, VS Code

Leadership: Team leadership, estimation and sprint planning, client communication, requirements analysis, code review, mentoring

Professional Experience

Finoit Technologies – Noida, India (Remote)

July 2019 – July 2026

Senior Software Engineer

January 2023 – July 2026

DDMind – Private Equity Research and Investment Analysis Platform – *Angular 16 to 20, AG-Grid Enterprise, AG Charts, RxJS, NGXS, WebSockets*

- Led a team of 2 developers as main developer; ran requirement analysis, estimation and planning directly with the client, the client's engineers and the PM.
- Brought 20,000+ financial records out of heavy Excel workbooks into the app, then re-architected AG-Grid views (17,000+ rows in one table) that loaded every page up front and froze after multiple file loads; moved to server-side pagination with on-demand page fetch, the infinite row model, row virtualization and a client-side page cache, cutting load time by 8–10 seconds and eliminating the freezes.
- Proposed and led the Angular v16 to v20 upgrade to meet the client's certification requirements (no CDN assets or deprecated dependencies); adopted standalone components, the new control flow, OnPush and trackBy, and removed unused packages, cutting bundle size 12% and build time 8%.
- Built config-driven navigation of 5–6 API-defined tabs with 6–7 sub-tabs each; kept the first view fast by loading main content first, then prefetching tab data in the background with cached responses so every tab opened ready.
- Extended AG-Grid with custom cellRenderers for API-driven markup and per-table tools that apply decimal and calculation changes instantly to numeric cells only, using valueFormatter and valueGetter.
- Built a reusable AG Charts component driven by config, used for almost all financial charts, and a WebSocket LLM chat with streaming responses over switchable OpenAI and Anthropic models.
- Reverse-engineered a reference product's market-data processing flow and replicated it on the frontend, shaping request and response structures so the backend could call the same market-data APIs consistently.
- Owned the state strategy (NGXS, NgRx and RxJS BehaviorSubject services at global, module and component level) and lazy-loaded nearly every module, splitting heavy features into sub-modules.
- Built direct-to-S3 uploads via pre-signed URLs (up to 50 MB per file, 10–25 files per organization) for a multi-tenant SaaS rollout.

CCM – Contract and Vendor Management Platform – *React, Next.js, Redux, TypeScript, WebSockets*

- Set up the production Next.js codebase from client-provided v0 UI, including architecture, tooling and reusable boilerplate, for a platform managing thousands of vendors and about 100 users.
- Reviewed code for 2 developers, then stabilized a codebase where forms broke almost daily until errors became rare; built the AI Sync streaming-chat module and the User module.
- Built complex forms with conditional, nested dependent fields and data tables for contracts and vendors.

Paper Tiger – Academic Research and Writing Platform – *React, Redux, DevExpress, TinyMCE, Google Cloud*

- Sole frontend engineer from empty repo to production: architecture, routing, error handling, API layer and OAuth 2.0 / Google Sign-In; built all five modules (Outliner, Reader, Explorer, Builder, Writer), including a DevExpress drag-and-drop Kanban, a TinyMCE editor with highlighting and annotation, and PDF upload and citation management.
- Handled about 2 MB of JSON per research paper on the client, with signed-URL uploads to Google Cloud Storage.

Block Power – Community Engagement and Voting Platform – *React, Redux; client: Harvard professor*

- Sole frontend engineer on a mobile-first app for about 250 users, with role-based access, referral points, rewards and voting flows; estimated work and took requirement calls directly with the client.

Across projects

- Established quality gates reused on DDMind and CCM: ESLint and Prettier on pre-push hooks, the same checks in GitHub Actions before deployment, and Dockerized dev environments.
- Built shared component folders and design tokens (SCSS variables, Tailwind theme) on every project, and mentored 6+ engineers, including engineers outside my own project teams, through code review, architecture discussions and debugging.
- Brought client- and company-provided AI tools (GitHub Copilot, Claude, ChatGPT, Codex) into the daily workflow for implementation planning, feature breakdowns, component generation and refactoring.

Software Engineer

January 2022 – January 2023

- Sole frontend engineer on Qbench, a laboratory SaaS portal: built a config-driven engine rendering dynamic forms and tables from backend configuration, and a Stripe Checkout billing and subscription module.
- Built direct uploads to Azure Blob Storage via pre-signed URLs and JWT-based authentication; added commenting and approval flows on Together Now.

Software Developer (joined as Trainee Software Developer)

July 2019 – January 2022

- Built Angular applications (Angular 7, 8 and 10) with NgRx and RxJS: Youxta (lawyer hiring, Stripe payments, booking), Ignite (drag-and-drop career-page builder) and Envy Pet Care (AG-Grid, FullCalendar).
- Integrated Gravity Payments via emulator for a client using physical payment hardware, and contributed to the Angular v6 to v8 upgrade.

Education

B.Tech, Computer Science & Engineering (Lateral Entry) – Maharaja Surajmal Institute of Technology, New Delhi 2014 – 2017

Diploma, Computer Science & Engineering – Ambedkar Polytechnic, New Delhi 2010 – 2013
